ACKNOWLEDGEMENTS

This work was funded by the California Energy Commission (Energy Commission) with assistance from Project Navigator Ltd (PNL). The authors gratefully acknowledge and thank New Cure Inc. (NCI), which manages the Operating Industries, Inc. (OII) Superfund Landfill site, for their help and collaboration during the course of this solar pilot program.

In particular, special thanks go to Mr. Ed Robles and Mr. Corey Bertelesen for providing site access and helping with the PV solar rack setup logistics.

PREFACE

The California Energy Commission Public Interest Energy Research (PIER) Program supports public interest energy research and development that will help improve the quality of life in California by bringing environmentally safe, affordable, and reliable energy services and products to the marketplace.

The PIER Program conducts public interest research, development, and demonstration (RD&D) projects to benefit California.

The PIER Program strives to conduct the most promising public interest energy research by partnering with RD&D entities, including individuals, businesses, utilities, and public or private research institutions.

PIER funding efforts are focused on the following RD&D program areas:

- Buildings End-Use Energy Efficiency
- Energy Innovations Small Grants
- Energy-Related Environmental Research
- Energy Systems Integration
- Environmentally Preferred Advanced Generation
- Industrial/Agricultural/Water End-Use Energy Efficiency
- Renewable Energy Technologies
- Transportation

California Landfill Solar Project: Evaluation of a Solar PV Racking System the final report for the California Landfill Solar Project (contract number 500-10-061) conducted by Project Navigator, Ltd. The information from this project contributes to PIER's Renewable Energy Technologies Program.

For more information about the PIER Program, please visit the Energy Commission's website at www.energy.ca.gov/research/ or contact the Energy Commission at 916-327-1551.

ABSTRACT

California is home to approximately 225 closed landfills that may be suitable for the development of utility scale solar farms. Closed landfill sites are ideally suited for the development of utility scale renewable energy projects because in general they are close to electricity demand, and transmission and distribution line infrastructure, are not economically viable for traditional development, consist of large flat parcels of previously disturbed land, under land use restrictions via institutional controls, and are already producing electricity from landfill gas. However, there has not been a comprehensive evaluation of a solar racking system on a closed landfill to assess the geotechnical effects on the integrity of the cover, the effect of vegetation growth and the evaluation of the power generated by a solar racking system on the top deck of a large landfill. The purpose of this project is to further investigate these key areas to lead to the design of a large scale solar farm.

This report evaluates the performance of a solar racking system at the closed Operating Industries Incorporated (OII) Landfill in Monterrey Park, California a suburb in Los Angeles County located 15 miles southeast from Downtown.

The system was placed at the landfill for over a year to assess its power performance and to assess its effect on the stability on the landfill cover. Geotechnical data collected during the project demonstrated that the solar racking system did not adversely affect the integrity of the landfill cover as the maximum displacement of the solar racking system was 0.6 mm. The average annual power generated from the solar racking system was 2 to 2.8 kW which was in agreement with the reported manufacturer value. The vegetation growth under the solar racking system was only slightly affected. No cap penetration was caused by the footings of the solar racking system. The results from this study indicated that a solar racking system on a closed large landfill is a feasible renewable alternative for closed landfills.

EXECUTIVE SUMMARY

California is home to approximately 225 closed landfills that can be suitable for the development of utility scale solar farms. Closed landfill sites are ideally suited for the development of utility scale renewable energy projects because, in general, they are close to electricity demand and transmission and distribution line infrastructure, are not economically viable for traditional development, consist of large flat parcels of previously disturbed land, are under land use restrictions via institutional controls, and are already producing electricity from landfill gas. However, there has not been a comprehensive evaluation of a solar racking system on a closed landfill to assess the geotechnical effect on the integrity of the landfill cover, the effect of vegetation growth, and the evaluation of the power generated by a solar racking system.

This report evaluates the performance of a solar photovoltaic racking system at a closed landfill in the Los Angeles area. The three specific research areas investigated during the project included a comprehensive evaluation of the geotechnical effects caused by the additional weight of the solar racking system on the landfill cover, the effect of vegetation growth under the solar racking system and the evaluation of the power production of the unit. Sunpods, Inc. of San Jose, California was the selected vendor of the solar racking system. The three units consisted of the following components:

- Unit 1: SP-100 Unit bare frame with weight added to simulate the weight (solar panels, inverter and electrical instrumentation) of full solar racking unit.
- Unit 2: SP-100 with plywood covering the rack with added weight (inverter and electrical instrumentation) to simulate the weight and shading of a full racking unit.
- Unit 3: SP-300 off-grid unit with solar panels and all electrical instrumentation necessary to generate and monitor electricity.

In February 2012, three solar racking units were installed at the Operating Industries Incorporated Landfill in Monterrey Park, California; a suburb in Los Angeles County located 15 miles southeast from Downtown. The solar racking system was placed on the top deck of the landfill for a period of one year to evaluate its power performance and effect on the stability of the landfill cover. Results from the project showed that the solar racking system did not have an effect on the integrity of the landfill cover as only a maximum displacement of 0.6 millimeter was measured during the year. The average annual power generated from the solar racking system was typically between 2 to 3 kW. The results from this study indicated that a solar racking system is a feasible renewable alternative for landfills sites.

Geotechnical Stability Analysis

The geotechnical evaluation on the integrity of the landfill cover consisted of measuring the weight placed on the landfill cover by four vibrating wire earth pressure / load cell sensors placed at the corner of two adjacent solar racking units. A deformation meter was used to monitor the vertical displacement cause by the weight of two solar racking units. All geotechnical sensors were placed in 1.5 feet deep trenches and backfilled. The footings of the four corners for the two adjacent solar racking units were located directly over the five backfilled trenches. The geotechnical sensors were set to log every hour for a period of a year.

Results from the load sensors indicated that the load of the two solar racking units varied between 0 to 26 kilopascal. The deformation meter used to monitor the vertical displacement caused by the two solar racking units indicated that the maximum displacement of the two adjacent solar racking units was 0.6 millimeter. Average settlement per year for this area is less than 25.4 millimeters (1 in.). Thus, the geotechnical data collected during the project showed that two solar racking units did not have a significant effect on the stability or increase the settlement of the landfill cover.

Power Performance of the Solar Racking System

The power performance of the solar racking system was another key research area for this project. The Unit 3 component of the solar racking system had a built in data logger that summarized the daily power performance. To evaluate the power performance of Unit 3 a solar radiation (pyranometer) sensor was placed on top of the edge of the unit to monitor the wattage per area generated by the sun. Below is a table summarizing the seasonal averages of Unit 3 and the solar radiation sensor data.

Season	Average Daily Power Generated by Unit 3 (kW)	Maximum Daily Solar Radiation (W/m ²)
Spring	2 to 2.8	778
Summer	2 to 2.8	904
Autumn	2	678
Winter	2	515

Table E1: Field Power and Solar Radiation Summary

As the data indicates in Table E1, the power performance of Unit 3 was in agreement with the manufacturer's rating of 2.8 kW. As the power performance of solar panels continues to increase and the cost continue to decrease over the years it will become more economically feasible to install larger solar farms on closed landfills. Every landfill is unique with regards to

location. The feasibility of installing a solar farm should be performed with detailed economic calculations in order to determine if the project is still viable.

Vegetation Growth Effect

The vegetation growth of a landfill cover is a key component that affects the stability of the cover. Vegetation reduces precipitation from infiltrating into the cover and prevents erosion of the landfill cover. During this study, the effects on the vegetation growth, as a result of placement of the solar racking system, was investigated. At each inspection of the solar racking system, the vegetation growth around the project area was documented and pictures were taken to record the vegetation growth throughout the year.

Observations and photographs taken from all inspections throughout the year indicated that the solar racking system did not have a detrimental effect on vegetation growth under the area of the solar racking system. No landfill cap penetration caused by the footings of the solar racking system was observed during the inspections. As the pictures taken during the inspections demonstrate, vegetation growth around the solar racking system was slightly affected by the solar racking system.

Conclusions and Recommendations

The purpose of this project was to evaluate the geotechnical effects and power performance of a solar panel racking system on a closed landfill. Geotechnical results indicated that the weight of the solar racking system did not contribute to additional settlement and did not compromise the integrity of the landfill cover. Power monitoring of the solar panel racking system indicated that the power efficiency was in agreement with the reported manufactured value. Since the solar panel industry continues to produce more efficient solar panel units this will contribute to larger solar farms becoming more economically feasible.

A scale-up from the pilot-study needs to be implemented before a full scale system is design. The scale-up should evaluate the following:

- 1) Investigate the effect of vegetation growth on a larger solar racking system.
- 2) Investigate the geotechnical effects when solar racking units are placed close to slopes.
- 3) Monitored the power produced from the solar racking units to the power grid system.
- 4) Evaluate the start-up and operational, maintenance and monitoring (OM&M) cost of a 1 acre solar farm.

CHAPTER 1: Introduction and Sitting Guidelines

1.1 Introduction

Project Navigator, Ltd. (PNL) has conducted an evaluation on the geotechnical and power performance of a solar racking system at a closed landfill. Closed landfills offer an opportunity to develop renewable energy sources such as landfill gas and solar power alternatives. Typical landfills consist of a fairly flat top deck that can be used to place a large number of solar panel units; offering an opportunity for installation of large solar farms. Further discussion on the development of solar photovoltaic (PV) guidelines is presented in the following section.

This report's purpose is to summarize the geotechnical, power performance and vegetation effects as a result of placing a solar racking system at a large closed landfill.

1.2 Guidelines for Developing a Solar PV Electricity Generating System on a Landfill

1.2.1 Background Information on PV Technologies

PV cells use the photoelectric effect to generate electricity. There are different types of PV technologies based on the materials used to manufacture PV cells. The three types of material used to manufacture PV cells consist of the following:

- **Mono-crystalline silicon:** Most efficient technology to date, with efficiencies of approximately 18% (commercial) to 28% (research), but also the most expensive.
- **Multi-crystalline silicon:** Cheaper to manufacture than mono-crystalline silicon but are less efficient. Research cells approach 24% efficiency and commercial modules approach around 16% efficiency.
- **Thin film:** Various materials are used to make thin film PV, such as amorphous silicon, Cadmium Telluride and Copper Indium Diselenide (CIS). They can be applied as a film to low cost substrates such as glass or plastic. Thin film PV is cheaper than crystalline silicon PV, however, efficiencies are lower.

Up to date crystalline silicon PV technologies are the dominant technologies and have been on the market longer than thin film technologies.

Many solar cells are connected together to form a solar module, with a power range of up to 220 watts. PV modules are connected together in arrays to generate electricity at the required

voltage and current level. Because PV modules generate direct current (DC), an inverter is required which converts the DC current into AC (alternating current), which can be feed into the grid.

PV power plants consist of thousands of modules arranged in a collector field. The modules are arranged in arrays and are mounted either in a fixed tilted position corresponding to the latitude or on a one or two-axis tracker. Large PV power plants (mega Watt [MW] range) have been constructed in Germany, Spain, the United States, Italy, and the Netherlands. Worldwide more than 250 large PV power plants with peak power of 1 MW or more are connected to public grids¹.

PV is a mature technology with many years of operation experience and several gigawatts (GW) being installed in recent years. Capital costs of PV systems are decreasing and capacity factors continue to increase making solar PV systems more economically viable. The grid connected market is currently dependent on market support programs, such as feed-in tariffs and power purchase agreements.

1.2.2 Why Landfills?

While large scale solar facilities are planned for throughout the United States, they face permitting, financing, and interconnect challenges. This is not true for urban located landfill sites.

Landfill sites are excellent platforms for PV solar facilities. Landfills usually have large flat acreage of land not suitable for most types of development. As indicated in Figure 1, urban landfills usually are located close to electric load and interconnect, putting this otherwise unusable acreage back to use.

¹ Information reference from <http://www.pv-power-plants.com>.

Figure 1: Conceptual Design of a PV Solar Facility on a Closed Landfill Located in Urban Area

There are numerous advantages for developing solar PV at a landfill. Normally, there are about 18 steps that a developer needs to perform in order for a typical PV solar facility to go from concept to reality. These steps are outlined below in Figure 2.

Figure 2: Flow Diagram Outlining Steps the Process for the Development a Solar Facility

As indicated in Figure 2², most of the challenges for a developer lie in the front end permitting. If a solar PV facility is to be sited at a closed cap landfill location, the permitting and environmental review process may be smoother than a project proposed for undisturbed land or land suitable for other uses. Most landfill locations properly closed through the Resource Conservation and Recovery Act (RCRA) process already contain extensive environmental documentation. These documents may need to be modified or amended if the post closure plan for the landfill did not include a solar PV facility. Also, a developer needs to keep in mind that a landfill is a location that has already been environmentally impacted and if the landfill was properly closed.

Another benefit for a developer would be a nearby grid interconnect. According to the United States Environmental Protection Agency (U. S. EPA)³ there are currently 74 landfill locations within California that generate electricity from the landfill-generated methane gas and export to the grid. A typical landfill can normally generate enough methane gas to sustain a landfill-gas-to energy plant for 10 to 15 years. Landfill gas is generated as a result of the biodegradation process of the waste. If a developer wanted to develop a solar facility and capitalize on the existing interconnect at the landfill site, then good candidate landfill sites would be ones that

² Figure 2 obtained from www.PVNavigator.com.

³ <http://www.epa.gov/lmop/projects-candidates/operational.html>.

the methane gas generation has significantly decreased, therefore providing excess capacity of the interconnect.

Most landfills are considered a liability and not an asset to the owner (which can be both the private and public sectors) of the landfill because of the obligation to operate and maintain the closed landfill until the regulatory agency determines that the landfill no longer needs to be monitored (usually 30+ years). Thus, landfill owners are constantly looking for ways (long-term leases) in order to capitalize on these liabilities and once again turn them into assets which can be a benefit to the developer of the solar PV facility.

1.2.3 Things a Developer Should Consider for Determining if a Landfill is a Good Site for a Solar PV Development

There are several key factors a developer should take in consideration in order to make the determination that a landfill is a good candidate site for the development of a solar PV facility. Some of these factors are the same as if the developer was performing due diligence on a PV site that was not a landfill (i.e. nearby interconnect and costs, interconnect capacity, power off taker, etc.). Some of the key factors specific to landfill that a developer would need to evaluate are:

- The quality, quantity, and availability of existing site characterization data, especially geotech information. If the proper documentation exists (which should if the landfill was closed under RCRA) then this key factor will keep costs for permitting down for the developer.
- Develop a solar layout early in the process. Most landfills are located on large parcels of land tens to hundreds of acres in size. However, most of the land suitable for a solar PV facility is located on the “top-deck” of the landfill which could limit the size of the solar facility. Also, it is usually not wise to penetrate the cap of the landfill since penetrating the cap will lead to methane gas escaping and will allow water to infiltrate the waste, so the layout of conduit should be done above ground.
- Cross check the solar layout vs. historic landfill settlement data. The age of the landfill is important since older waste has a tendency to settle less than younger waste as a result of the biodegradation process. If a landfill has an area that is historically settling a lot (4”+ per year), the developer might want to avoid this area or perform a detailed geotech evaluation to ensure that this area is appropriate for a solar development.
- Determine if the site is available for lease or purchase. A developer may not want to purchase a landfill parcel and rather lease it to help avoid future liability and maintenance costs that could come from the landfill.

- Early in the process initiate outreach efforts to the surrounding community and the appropriate regulators, including municipal, state and federal agencies as well as utilities. A fact sheet is a good way to help communicate what the developer's plans are for the project and can be useful when speaking with regulators and the public.

1.3 Project Description and Purpose

The California Landfill Solar Project was developed to evaluate the feasibility of placing a solar PV racking system at a closed large landfill. The project's primary objectives were to evaluate the following:

- Geotechnical effects (e.g. additional settlement) of placing a solar racking system on a closed landfill;
- Power performance of the solar racking unit; and
- Monitor the effect of the decreased amount of sunlight caused by the solar racking system on vegetation growth.

The technical approach in this project focused on understanding the effect of placing a solar PV racking system on the top deck of a landfill. To monitor the effect of the solar PV racking system the following sensors were utilized to complete this evaluation:

- Four Earth Pressure / Load cells to continuously monitor the load of the solar racking system;
- One deformation meter to monitor the vertical displacement caused by the solar racking system;
- MATE3 power data logger to monitor the efficiency of the SunPods unit; and
- One solar radiation (pyranometer) sensor.

This project was funded by the California Energy Commission and, in part, by PNL.

1.4 Report Organization

The remaining sections of this report are organized as follows:

- Chapter 2.0 – Project Background

- Chapter 3.0 – Installation and Mobilization of the Solar Racking System
- Chapter 4.0 – Inspections of Solar Racking System
- Chapter 5.0 – Summary Monitoring Results
- Chapter 6.0 – Conclusions and Recommendations

CHAPTER 2: Project Background

California is currently home to 225⁴ closed landfills that may be suitable for the development of utility scale solar farms. The 225 closed landfill sites in California occupy 35,000 acres of land that is currently not economically viable for traditional development. Although this report focuses on performing research on developing utility-scale PV solar developments on a closed capped landfill, there are also 1,262 contaminated sites occupying over 2 million acres in California where the results of the research may be further applicable. There are currently 74 landfill locations within California that are producing electricity from the landfill generated methane gas. These landfills utilize landfill generated methane gas in micro-turbines to generate electricity. Closed landfill sites are ideally suited for the development of utility scale renewable energy projects since, in general, they are:

- Close to electricity demand;
- Close to transmission and distribution line infrastructure;
- Not economically viable for traditional development;
- Under regulatory restrictions via institutional controls;
- Large flat parcels of previously disturbed land; and
- Already producing electricity from landfill gas.

Although these sites at first seem ideal for the development of large scale renewable energy projects, there are some critical technical parameters which need to be further investigated and studied before a large scale renewable energy solar-landfill can be developed. To date, there are limited reference materials and data available to the solar-landfill developer, such that each project is uniquely designed without a significant background of technical guidance and essential design criteria. Geotechnical data collected during this project will facilitate in the scale-up and design of larger solar facilities.

⁴ See <http://www.epa.gov/oswercpa/> for additional information regarding the number of closed landfill sites and contaminated sites in California.

This project focused on design-critical topics such as PV racking systems to minimize cap penetration, long-term landfill settlement, storm water runoff, seismic stability, and the overall effects a renewable energy project would have on the vegetative growth component of an evapotranspirative (ET) landfill cap/cover (specific to California).

This report presents an evaluation of the performance of a self ballasting racking solar PV system “the solar racking system”. The project involved the placement, and one-year monitoring of an instrumented, self contained, racking solar system on a closed landfill site. Project Navigator, Ltd. (PNL) purchased a solar racking system from SunPods, Inc. located in San Jose, California. The SunPods units are self-ballasted, in theory. As a result, the units did not penetrate the cap of a landfill. This issue had not previously been exhaustively field tested under well monitored conditions at a pilot scale level.

During the pilot study, data was collected that encompassed the issues outlined above. This data is compiled and discussed in this report. This benefits the overall PV solar power development in California by providing geotechnical data that show that the placement of a solar racking system will not affect the integrity of a landfill cover. However, when siting PV the age of the landfills and the extent of the biodegradation of waste should also be considered.

2.1 Project Description and Objective

Performance was measured in terms of soil settlement, solar radiation, vegetative growth and solar panel power output. The project consisted of the assembly of three solar panel racking units to monitor the impacts of these units on the cover of the landfill top deck. The project included:

1. Identification of a landfill site for the placement of a solar panel racking system.
2. Project documentation consisting of a Project Work Plan (WP).
3. Procurement and tracking of all materials required for a solar panel racking and monitoring system.
4. Mobilization of the solar racking system and instrumentation to the selected landfill site.
5. Assembly and placement of a solar racking system on the top deck of the selected landfill.
6. Installation of sensors and data loggers to monitor soil pressure (load), soil deformation (movement), solar radiation and solar panel power output.

7. Monthly landfill visits to inspect the solar racking system and download field data.
8. Development and analysis of a field database.
9. Demobilization of solar racking system and instrumentation from the landfill.

2.2 Landfill Site Description

2.2.1 Landfill Pilot Study Location

The Operating Industries Inc., (OII) Landfill Superfund Site located at 900 Potrero Grande Drive, Monterey Park, California, was selected as the pilot study location. The site was selected based on the following criteria:

- Proximity to local power station;
- Closed landfill with a 2 foot cover;
- Excellent characterization of site (i.e. extensive geotechnical studies / data);
- Relatively flat top deck area; and
- Large deck area for future solar facility scale-up.

The site operated from 1948 to 1984 and accepted 30 million tons of solid municipal waste and 300 million gallons of liquid chemicals. The Pomona Freeway divides the 190-Acre site into two parcels namely, the south parcel (SP) and north parcel (NP). The SP portion of the site consists of 145 acres while the NP consists of the remaining 45 acres. In January 1984, the State of California placed the site on the California Hazardous Waste Priority List⁵ because of its contamination of air (e.g. methane, vinyl chloride etc.), groundwater (e.g. tetrachloroethylene, benzene, chloroform etc.), soil media and the concern of the well-being of the nearby community. The site formally ceased operations in 1984. The U.S. EPA placed the site on the Superfund's National Priority List in May 1986. Figure 3 shows the location of the site. The solar panel units were placed at the top deck of the SP. The landfill is currently in Operational Maintenance and Monitoring (OM&M) since the SP remedy was completed in 2000. OM&M activities include the following tasks:

⁵ <http://www.epa.gov/region9/cleanup/california.html>.

- Since the geomembrane liner (located 2 ft below the grade) was not penetrated during the study, no permits were required to conduct the project. The liner's function as part of the landfill cover is to control the migration of landfill gas and to prevent the infiltration of liquids.

2.2.2 Selection of Area within the Site

The solar racking system was placed on the top deck of SP in two areas that are representative of the landfill. Two solar racking units were placed in the vicinity of a settlement monument so that data could be used to validate the information collected from the deformation sensor.

Settlement monuments at the site are currently surveyed twice a year. More than ten years of settlement data has been collected for this location at SP and was the ideal location to place the solar racking system. Figure 4 shows the location of the solar racking units on the top deck of SP. Three solar panel racking units were placed to mimic a solar panel array. Two solar racking units were placed next to each other while the other unit was placed approximately 100 feet from the first two and aligned to represent the end of the row of solar panels.

Figure 4: Location of Solar Racking Units at Site

CHAPTER 3: Component Description and Placement of the Solar Racking System

This chapter presents details of the specific components that made up the solar racking system and the description on how the solar racking system was placed on the top deck of the SP at the site. See Appendix A for the California landfill Solar Project: Solar Rack System Installation and Sampling Work Plan.

3.1 Description of Solar Racking System Components

3.1.1 Solar Panel Racking System Components

PNL purchased three self-ballasting solar panel racking units which consist of the following components:

- Unit 1: SP-100 Unit bare frame with weight added to simulate the weight (solar panels, inverter and electrical instrumentation) of full solar racking unit.
- Unit 2: SP-100 with plywood covering the rack with added weight (inverter and electrical instrumentation) to simulate the weight and shading of a full racking unit.
- Unit 3: SP-300 off-grid unit with solar panels and all electrical instrumentation necessary to generate and monitor electricity.

Photo 1 shows all three Units at the OII Landfill. Sunpods, Inc. was the vendor selected to provide the three solar racking units. All three solar racking units were assembled at the Sunpods, Inc. San Jose facility and the units were delivered to the site during January and February 2012. All solar racking units were delivered by a pickup truck pulling a unit that was placed on a trailer and delivered to the site. The pickup truck with the equipment trailer was escorted to the top deck of the SP of the site through the landfills access road by operational personnel from New Cure Inc. (NCI) personnel. Once on the top deck the pickup truck went off the access road to place the solar racking units on a staging area until they were allowed to be placed on their final location once the monitoring system was installed.

Placement of solar panel units is shown on Figure 4 and was performed by Sunpods field personnel. No solar racking units were placed on slopes of the site. All units were placed on the top deck of SP which is relatively flat. Solar panel units are self-ballasted and were not anchored to the ground surface. The units were designed to withstand winds of 90 miles per hour (mph). Average winds speed in Los Angeles throughout the year are approximately 6 mph with maximum speed of about 21 mph (measured on February 13, 2012). Units 2 and 3 were place

adjacent to each other. The area of each frame was approximately 9.52 ft x 21.75 ft, the length of the unit legs were 32 inches and the area of the foot of each leg is 1 square foot. Unit 3 had a total of 12 small individual panels rated each at 235 watts for a total of 2820 watts for the 12 panels. Each individual panel was 3.17 ft x 5.43 ft and the total for the 12 panels was 9.52 ft x 21.75 ft. To store the energy generated by Unit 3, two 12-volt batteries gel type 8G8DLTP MK were used for the project. An Outback FM 80 charge controller was used to regulate the energy load to the two batteries. Typically the weight of a solar racking unit (Unit 3) is approximately 2,000 lbs. To replicate this weight, an additional 700 lbs was added to Unit 1 and 500 lbs was added to Unit 2.

Unit 1

Unit 2

Unit 3

Photo 1: Photos of Unit 1, Unit 2 and Unit 3

3.1.2 Monitoring System Components

The geotechnical monitoring system consisted of the following components:

Geokon Vibrating Wire (VW) Earth Pressure / Load Cell Model 4800-1-70kPa: Four Vibrating Wire (VW) Earth Pressure / Load Cells from Geokon Inc. were used to monitor the load placed on the cover of the landfill by the solar racking system. Earth Pressure Cells are designed to measure stresses in soil and the pressure of soil on structures / equipment. The Earth Pressure Cells used in the project were constructed of two stainless steel flat plates that are welded together around the periphery and separated by a small space that is filled with hydraulic fluid. When a load is applied, the pressure acts to squeeze the two plates resulting in the buildup of pressure inside the fluid. The hydraulic fluid is connected hydraulically to a pressure transducer where the fluid pressure is converted to an electrical signal and further is transmitted through a cable to the data logger (Geokon Model 8002-4-2). The Earth Pressure / Load Cells were calibrated to read loads up to 70 kPa, however they can measure loads up to 20 MPa if calibrated properly. The Earth Pressure / Load cells were calibrated at the lower load end for the project. The four Earth Pressure / Load Cells were placed under the outer legs of the adjacent racking units as shown on Figure 5. Photo 2 shows an image of a Geokon Earth Pressure / Load Cell placed inside a trench.

Photo 2: Geokon Earth Pressure / Load Cell Placed Inside a Trench

All Earth Pressure / Load Cells were calibrated by Geokon Inc.

Geokon Data Logger Model 8002-4-2: One Data Logger Model 8002-4-2 was used to collect field data from the four Earth Pressure / Load Cells. Model 8002-4-2 is a battery powered four channel data logger and reads four VW sensors equipment with thermistors. Thermistors measured temperature at the four locations of the sensors. Temperature readings from the thermistors were used to account for a correction factor associated with temperature differences throughout the year on the load measurements. The data logger included a USB cord to allow easy download of data and was enclosed in a NEMA 4X protective box. The data logger included Geokon LogView software to allow the communication between the data logger and a computer. At a constant temperature of 25 °C, the battery life of two D-Cell lithium batteries at a sampling frequency of 1 hr can operate at a maximum of one year without battery replacements. The sampling frequency of the geotechnical sensors was set to every hour throughout the duration of the project (e.g. 24 sample points per day). Photo 3 shows the Geokon data logger model 8002-4-2 attached to Unit 2 and Unit 3.

Photo 3: Geokon Data Logger Model 8002-4-2

Geokon VW Deformation Meter Model 4430: One Deformation Meter was used to collect axial deformation in the landfill cover as a result of the solar panel racking system load. The deformation meter consists of a vibration wire (VW) strain gage in series with a precision music wire spring which is coupled to a movable shaft. As the shaft moves in and out of the sensor, the tension in the spring and the VW strain gage changes. The change in tension is directly proportional to the amount of extension and a calibration factor that relates the frequency of vibration to the amount of extension is determined. The deformation meter consists of a VW sensor that is attached to a flange at one end and connected by a rod of a specific length to a flange at the other end. The VW sensor and rod are covered by polyvinyl chloride (PVC) tube which holds the flanges apart at a predetermined distance and insures that the rod is free to move and also holds a thermistor. As the flanges move apart the movement is conveyed by the connected rod to the VW sensor and recorded by a data logger, see Photo 4.

Photo 4: Geokon Deformation Sensor Placed Inside a Trench

Geokon Data Logger Model 8002-1-2: One Data Logger Model 8002-1-2 was used to collect field data from the single deformation sensor. Model 8002-1-2 is a single channel battery powered data logger and reads one VW sensors equipment with thermistors. Temperature readings from the thermistors are used to account for a correction factor associated with temperature differences throughout the year on displacement. The data logger includes a USB cord to allow easy download of data and is enclosed in a NEMA 4X protective box. The data logger included Geokon LogView software to allow the communication between the data logger and a PC. At a constant temperature of 25 °C the battery life of two D-Cell lithium batteries at a sampling frequency of 1 hr can operate at a maximum of two years without battery replacements. The sampling frequency of the geotechnical sensors was set to every hour for the duration of the project (e.g. 24 sample points per day). Photo 5 shows an image of the Geokon Data Logger Model 8002-1-2.

Photo 5: Geokon Data Logger Model 8002-1-2

[illegible]

Onset Solar Radiation Sensor S-LIB-M003: The Onset Solar Radiation sensor is a precision pyranometer that utilizes a high stability silicon photovoltaic detector to obtain accurate solar radiation readings. The pyranometer used is rated at 1,280 W / m². The output signal from the pyranometer is 4-20 mA. Photo 7 shows an image of the Onset Solar Radiation Sensor used in the Project.

HOBO Micro Station Data Logger: The Hobo Micro Station Data Logger is a four channel input data logger manufactured by Onset Computer Corporation and comes with a NEMA 4X protective enclosure for harsh environments. Data is downloaded through a USB cable and lithium batteries are rated for one year for a sampling rate of 1 min. The data logger was used to log data from the pyranometer. See Photo 8.

Photo 8: Onset Four Channel Data Logger Used to Log Data from Solar Radiation Sensor

3.3 Solar Panel Racking System Assembly and Placement

Units 1 and 2 arriving at the Site

Unit 3 arriving at Site

Photo 9: Solar Racking Units Arriving at the OII Landfill

Prior to the arrival of Unit 3, trenches were prepared for geotechnical sensors and backfilled with landfill cover material. Photo 9 shows the three Units arriving at the OII Landfill. To ensure that the liner was not penetrated the trenches were excavated at a maximum depth of 1.5 ft. Preparation of shallow trenches were conducted by using shovels and the placement and installation of sensors was conducted by an electrician. The preparation of the five (four

trenches for the earth pressure / load cell and one trench for the deformation sensor) trenches was conducted on February 8, 2012. Four earth pressure / load cells were placed at the corners of Unit 2 and Unit 3.

All Health and Safety procedures were in accordance with NCI Health and Safety Plan. The following procedures were implemented to ensure that the monitoring system was installed in accordance with the manufacturer recommendations.

3.3.1 VW Earth Pressure / Load Cell Sensor Installation Procedures

Before the placement of any Earth Pressure / Load Cell, the functionality of the Earth Pressure/ Load Cell was checked. To check the functionality of the Earth Pressure / Load Cell, it was pressed on to ensure that the readout digits changed. Increasing the pressure on the Earth Pressure / Load Cells caused the readout digits to fall on each sensor indicating it was working correctly. Checking for electrical continuity was also important to ensure that the Earth Pressure /Load Cells were properly functioning. Using an ohmmeter, the resistance between the VW strain gage leads was checked and showed proper functioning at 180 ohms. See Appendix A for the instructions used to install the VW Earth Pressure / Load Cells inside the landfill cover at the site.

3.3.2 VW Deformation Meter

Before the placement of the VW strain gage / Deformation Meter, the functionality of the meter was properly checked. In position "B" the VW strain gage read between 2,000 and 8,000 digits as suggested from the instruction manual. A slight pull on the end of one of the flanges caused the reading to increase. Since the reading did increase then the VW deformation meter showed that it was functioning properly. Similar to the VW Earth Pressure /Load Cell the electrical continuity was checked using an ohmmeter. The resistance between the VW strain gage was approximately 180 ohms indicating that the electrical continuity was correct. See Appendix A for the instructions used to install the VW Deformation Meter inside the landfill cover at the site.

3.3.3 Geokon Data Loggers

Four VW Earth Pressure Cells were connected to the Model 8002-4-2 data logger. The VW Deformation Meter was connected to the Model 8002-1-2 data logger.

3.3.4 Onset Solar Radiation Sensor S-LIB-M003 and Micro Station Data Logger

See Appendix A for the instructions used to install the Onset Solar Radiation sensor to the Hobo Micro Station Data Logger.

Vegetation was removed in areas where geotechnical sensors trenches were prepared. The five areas of vegetation consisting of 2 ¼ x 2 ¼ sq ft was removed by using a shovel. Once all trenches were prepared and sensors were checked for proper functionality, the sensors were placed in trenches. The cement grout mixture was prepared for the four Earth Pressure / Load Cells and was allowed to dry for 24 hours.

Unit 3 was delivered to the site on February 9, 2012. Before the placement of the three units, the cement grout mixtures at the four trenches were checked to ensure that they were dried. All cement grout mixtures were dried and the functionality of all sensors and data loggers were checked one final time to ensure proper functionality. All trenches were backfilled as outlined in Appendix A. The units were then finally placed in their final location as shown in Figure 4. The location of the Earth Pressure Load Cells (EPLC) and Deformation Meter (DM) sensors are shown in Figure 5.

Figure 5: Monitoring Locations of Geotechnical Sensors

3.3.5 Placement of Additional Weight on Unit 1 and Unit 2

During the March and April 2012 inspection the additional weight to Unit 1 and Unit 2 was added by using sand bags to simulate the effect of the weight of a full scale unit on the landfill cover. Seven hundred lbs of sand bags was added to Unit 1 and 500 lbs were added to Unit 2. All sand bags were tied to the frame of Unit 1 and Unit 2 with rope as in Photo 10.

Photo 10: Sand Bags Tied to Unit 1 and Unit 2 to Simulate Actual Weight of Solar Unit

CHAPTER 4: Inspections of Solar Racking System

After the placement of the solar racking system was completed, inspections of the solar racking units occurred on a biweekly basis for the first few months. Once the system was shown to function properly over a span of several weeks the frequency of inspections was reduced to monthly/bimonthly basis.

The purpose of each site inspection of the solar racking system consisted of the following tasks:

- Inspect that the monitoring system was working properly;
- Download all data recorded from data loggers;
- Check that Unit 3 was working properly;
- Check that the sand bags placed on Unit 1 and Unit 2 were still intact;
- Visual inspection of the vegetation grown in the area of the solar racking unit; and
- Photographs to document any changes / effects caused by the placement of the solar racking system.

4.1 VW Earth Pressure / Load Cell Inspection

Throughout the project the Earth Pressure / Load Cells were functioning properly and no issues were noted during the inspections.

4.2 VW Deformation Meter

Throughout the project the Deformation Meter was functioning properly and no issues were noted during the inspections.

4.3 Solar Radiation Sensor (Pyranometer)

The initial pyranometer that was purchased for the project did not function properly so as a result the first pyranometer was returned to the manufacturer. The second pyranometer was checked before it was installed on the side of the solar racking system. Throughout the project the second pyranometer was functioning properly and no issues were noted during the inspections.

4.4 Visual Inspection of Vegetation Growth in the Area of the Solar Racking System

Visual inspection of the vegetation growth throughout the project was observed in the area of the solar racking system. Vegetation growth is a crucial component of the integrity of a landfill cover. At the site an evapotranspiration (ET) cover system was constructed in 2000 as part of the final remedy for the SP. ET cover systems rely on the properties of the soil to store water until it is either transpired through vegetation or evaporated from the soil surface. The function of the ET cover system is the following:

- Control moisture and percolation;
- Surface water runoff;
- Minimize erosion;
- Prevent direct exposure to waste;
- Control gas and odors;
- Prevent occurrence of disease vectors and other nuisances; and
- Meet aesthetic and other end-use purposes.

The vegetative component of the ET cover system contributes to minimizing the erosion of the soil material on the landfill cover, transpiration of water stored in the soil and for aesthetic reasons. Throughout the year the vegetation growth was observed beneath the solar panel units and compared to the adjacent area around the two solar panel units. The observations regarding the vegetation growth are summarized below. A typical landfill cover is illustrated in Figure 6.

Figure 6: Typical RCRA Landfill Cover

4.4.1 Spring 2012 (March through May)

During the spring time the ET cover was generally green as a result of several rain events during the season. All wind speed, temperature and precipitation data was obtain from the local Monterey Park Weather Underground Station⁶. The major rain events during the spring time are summarized in the table below:

Date	Precipitation (in)
March 17, 2012	0.75
March 24, 2012	0.91
April 10, 2012	0.15
April 11, 2012	0.58
April 13, 2012	0.49
April 25, 2012	0.20
April 26, 2012	0.29

Table 1: Spring 2012 Rain Events (Weather Underground)

Photo 11: Vegetation Growth under Unit 2 and 3 during Spring 2012

Photo 11 shows the vegetation growth was slightly affected by Unit 2 and Unit 3. No solar panels or plywood were installed on Unit 1 so as a result the vegetation around Unit 1 was not affected. No cap penetration caused by the footings of the solar racking system was observed. Vegetation growth did not return in the area where the five trenches were located. Re-seeding

⁶ www.wunderground.com.

of vegetation was not performed in the trench area. No increase in gopher holes were observed in the area of Unit 2 and Unit 3 compared to the rest of the top deck.

4.4.2 Summer 2012 (June through August)

The vegetation on the ET cover during the summer months begins to dry due to a lack of rain events during this season. During the summer of 2012 no rain events were reported at the site. Photo 12 shows the vegetation on the ET cover was typically dry. Observations noted during inspections in summer did not show a significant difference in the amount of vegetation growth under the solar racking units compared to the surrounding area.

Photo 12: Vegetation Growth under Unit 2 and Unit 3 during Summer 2012.

Photo 12 shows, the vegetation on the cover was dried throughout the site. The vegetation under Unit 2 and Unit 3 was not different compared to the adjacent area. No cap penetration caused by the footings of the solar racking system was observed. No increase in gopher holes were observed in the area of Unit 2 and Unit 3 compared to the rest of the top deck.

4.4.3 Autumn 2012 (September through November)

Similar to summer, autumn is typically a dry period for the area. During the autumn months four rain events were reported at the site. The four rain events are summarized in Table 2.

Date	Precipitation (in)
October 11, 2012	0.63
November 17, 2012	0.16
November 29, 2012	0.18
November 30, 2012	0.35

Table 2: Autumn 2012 Rain Events (from Weather Underground)

Photo 13 shows the vegetation growth under the solar racking system continued to be similar with the surrounding area. No cap penetration caused by the footings of the solar racking system was observed. No increase in gopher holes were observed in the area of Unit 2 and Unit 3 compared to the rest of the top deck.

Photo 13: Vegetation Growth under Unit 2 during Autumn 2012

4.4.4 Winter 2012 / 2013 (December through February)

Winter is typically the wettest season for the area. During the winter of 2012/2013 a total of 9 rain events were reported at the site. A summary of the rain events is summarized in Table 3.

Date	Precipitation (in)
December 3, 2012	0.19
December 18, 2012	0.43
December 24, 2012	0.46
December 26, 2012	0.33
December 29, 2012	0.45
January 6, 2013	0.12
January 24, 2013	0.79
January 25, 2013	0.17
February 19, 2013	0.18

Table 3: Winter 2012/2013 Rain Events (from Weather Underground)

Observations noted during inspections in winter did not show a significant difference in the amount of vegetation growth under the solar racking units compared to the surrounding area as shown in Photo 14. No cap penetration caused by the footings of the solar racking system

was observed. No increase in gopher holes were observed in the area of Unit 2 and Unit 3 compared to the rest of the top deck.

Photo 14: Vegetation Growth under Unit 2 and Unit 3 during Winter 2012.

4.4.5 Spring 2013 (March through May)

During the spring of 2013 only one rain event was reported at the site. The rain event occurred on March 8 and precipitation amount was 0.49 in. Photo 15 shows the vegetation under the two solar racking units is not significantly different compared to its surrounding areas. No cap penetration caused by the footings of the solar racking system was observed. Vegetation growth did not return in the area where the five trenches were located. Re-seeding of vegetation was not performed in the trench area. No increase in gopher holes were observed in the area of Unit 2 and Unit 3 compared to the rest of the top deck.

Photo 15: Vegetation Growth under Unit 2 and Unit 3 during Spring 2013.

Overall observations made throughout the year indicated that the solar racking system did not have a significant effect on the growth of vegetation in the area of the project. No cap penetration caused by the footings of the solar racking system was observed during the project.

CHAPTER 5: Summary of Results

Results provided in this report are based on monitoring results from February 2012 through May 2013. The raw data collected can be found in Appendix B. Data collected during the project consisted of the following:

Weather Data

Weather data consisting of temperature, barometric pressure, wind speed, wind direction and precipitation was collected from the Monterey Park Weather Station adjacent to the site and obtained from Weather Underground. This data was collected to see if temperature and wind speed had an effect on the load caused by the placement of the solar racking units. Wind speed data was collected to correlate any relationship that the effect of high winds had on the load of the solar racking units. Temperature also has an effect on the readings measured by the geotechnical sensors. As outlined in Appendix A, a temperature correction factor needs to be calculated to account for the seasonal temperature fluctuations. Temperature data was also used to try to correlate a relationship between temperature and solar radiation data. Solar radiation is a measurement of potential energy provided by the sun.

Load Data

Load data was collected to measure the load caused by the placement of the solar racking system on the landfill cover. Significant loads reading during this study included anything above 50 kPA.

Deformation Data

Deformation data was collected to measure the vertical displacement / settlement caused by the placement of the solar racking system. Since the landfill cover was placed in 2000 it was estimated that the vertical displacement caused by the placement of the solar racking system would be minimal (significant changes would be measured in the range of centimeters [cm] and above). A key component that causes settlement at a landfill is the effect of the biodegradation of the waste. Older waste (20 years or more) that was been placed at a landfill has undergone a significant amount of biodegradation and the amount of settlement will typically decrease over the years. While younger waste will biodegrade more (generate more landfill gas) and experience more settlement (settlement can be in the range in inches or even feet). Thus, typically younger landfills will have more settlement than older landfills. When placing a solar racking system at a closed landfill it is important to consider the age of the waste in regards to

potential settlement. During this project it was estimated that settlement would not be significant since the age of the waste at the site is over 20 years.

Power Data

Power data was collected during the project to monitor the efficiency of the solar panels on Unit 3.

Solar Radiation Data

Solar radiation data was collected to measure the potential energy provided by the sun for the area.

5.1 Earth Pressure / Load Cell Monitoring System

The Earth Pressure / Load Cell sensors data was collected in units of readout digits. To convert readout digits into kPa see Appendix A for example calculations. To account for temperature fluctuations a temperature correction factor is included in the calculations. The Earth Pressure / Load Cells included a thermistor to account for any temperature correction factor throughout the year. The load throughout the year was not expected to change or be significant since no additional weight was added to the unit. Table 4 provides the Earth Pressure / Load Cell calibration data from Geokon Inc. used to calculate the load at each sensor.

Earth Pressure / Load Cell Sensor Number	Liner Gage Factor (G) in kPa / digits	Thermal Factor (K) in kPa / °C	Regression Zero
EPLC-1	-0.02409	0.1290	9472
EPLC-2	-0.02319	0.08885	9278
EPLC-3	-0.02251	0.07212	9310
EPLC-4	-0.03409	0.1209	9310

Table 4: Earth Pressure / Load Cell Calibration Data (Geokon Inc.)

5.1.1 Results for Earth Pressure / Load Cells

Figure 7 shows the effect of the daily average temperature (green line with triangles) on the load from Earth Pressure Load Cells (EPLC) EPLC-1 (blue line with diamonds) and EPLC-2 (pink line with squares). EPLC-1 and EPLC-2 were both under Unit 3 as shown in Figure 5. Figure 7 shows the average temperatures compared to the load on EPLC-1 and EPLC-2. The load change in EPLC-1 throughout the year ranged from 0 to 16 kPa, while the load change measured at EPLC-2 range from 0 to 26 kPa. The overall load from EPLC-1 and EPLC-2 during the year did not change significantly (above 50 kPa). However, temperature variation

throughout the year appeared to have an effect on seasonal temperature fluctuations from the temperature correction factor. Figure 8 is similar to Figure 7 except the load change from EPLC-1 (blue lines with diamonds) and EPLC-2 (pink line with squares) is compared to the average wind speed (green line with triangles) measured throughout the year. Average wind speed data measured throughout the year indicated that wind speed did not have an effect on the load change at EPLC-1 and EPLC-2.

Figure 9 shows the effect of the daily average temperature (green line with triangles) on the load change at EPLC-3 (blue line with diamonds) and EPLC-4 (pink line with squares). EPLC-3 and EPLC-4 are both under Unit 2 as shown in Figure 5. Figure 9 shows the average temperatures compared to the load on EPLC-3 and EPLC-4. The change of load at EPLC-3 throughout the year ranged from 0 to 15 kPa, while the change of load change at EPLC-4 ranged from 0 to 18 kPa. The overall load from EPLC-3 and EPLC-4 during the year did not change significantly. However based on the temperature correction factor, temperature variation throughout the year appeared to have an effect on seasonal temperature fluctuations. Figure 10 shows the effect of the average wind speed (green line with triangles) at EPLC-3 (blue line with diamonds) and EPLC-4 (pink line with squares) throughout the year. As previously shown, the average wind speed did not have an effect on EPLC-3 and EPL-4.

Figure 7: Time vs Load and Temperature at EPLC-1 and EPLC-2

Figure 8: Time vs Load and Wind Speed at EPLC-1 and EPLC-2

Overall the monitoring data at EPLC-1, EPLC-2, EPLC-3 and EPLC-4 showed that the changes in load caused by Unit 2 and Unit 3 were not significant (above 50 kPa) during the year.

Figure 9: Time vs Load and Temperature at EPLC-3 and EPLC-4

Figure 10: Time vs Load and Wind Speed at EPLC-3 and EPLC-4

5.2 Deformation Meter Monitoring System

The deformation meter data was collected in units of readout digits. To convert readout digits into mm see Appendix A. Table 5 provides the displacement calibration data from Geokon Inc. used to calculate the load at each sensor.

Deformation Meter Sensor Number	Liner Gage Factor (G) in mm / digits	Regression Zero
DM-1	0.002403	2737

Table 5: Displacement Meter Calibration Data (Geokon Inc.)

5.2.1 Results for Deformation Meter

Figure 11 shows the results of the deformation sensor (blue line with diamonds) throughout the year. The deformation sensor was placed in the middle of Unit 2 and Unit 3 as shown in Figure 5. As the monitoring data shows, the displacement caused by Unit 2 and Unit 3 ranged from 0.2 to 0.4 mm. These changes were not as significant as the displacement that has occurred as a result of significant biodegradation at the OII Landfill since the waste was placed over 20 years ago. Total displacement or settlement caused by biodegradation over the last 20 years at the OII Landfill has been measured over 1 foot. When the temperature increased (pink line with squares) at the site, the change in displacement decreased, and when the temperature decreased at the site, the change in displacement increased, showing the effect of seasonal temperature fluctuation. Temperature changes throughout the year appear to have a seasonal fluctuation effect on the displacement of Unit 2 and Unit 3 as shown in Figure 11. Figure 12 is similar to Figure 11 except that the average wind speed (pink line with squares) is compared to the displacement (blue line with diamonds) of Unit 2 and Unit 3. Average wind speed did not have a seasonal effect on the displacement of Unit 2 and Unit 3.

Overall the results from the deformation meter indicated that the displacement caused by Unit 2 and Unit 3 were not significant.

Figure 11: Time vs Displacement and Temp

Figure 12: Time vs Displacement and Wind Speed

5.3 Solar Radiation Sensor

Figure 13 shows the maximum daily solar radiation and maximum daily temperature data from April 2012 to April 2013. Solar radiation potential is important to measure because it indicates the energy potential from the sun. The higher the solar radiation, the higher the energy potential available from the sun. Figure 13 shows that as the temperature increased at the site solar radiation also increased. The solar radiation at the site ranged between 342 to 1001 W/m^2 during spring, 537 to 1181 W/m^2 during summer, 113 to 919 W/m^2 during autumn and 113 to 989 W/m^2 during winter. Data collected from the solar radiation sensor further verified that the site is an excellent candidate to place solar racking units because of the high solar radiation potential measured at the site.

Figure 13: Time vs Maximum Daily Solar Radiation and Maximum Daily Temperature

5.4 Unit 3 Power Performance

Figure 14 shows the daily kw-hr produced by Unit 3 compared to the maximum daily solar radiation. When the maximum daily solar radiation increased, generation also increased. The maximum kw-hr generated by Unit 3 occurred during the summer months when the maximum solar radiation was measured. During the autumn and winter months as the solar radiation potential decreased, the kw-hr generated from Unit 3 also declined. Figure 15 shows the daily ampere generated by Unit 3. Similar to Figure 14 as the solar radiation increased the daily ampere also increased and when the solar radiation decreased the daily ampere decreased.

Figure 14: Time vs kW and Daily Maximum Solar Radiation

Figure 15: Time vs Ampere and Daily Maximum Solar Radiation

Table 6 summarizing the seasonal daily averages for power and solar radiation.

Season	Average Daily Power Generated by Unit 3 (kW)	Maximum Daily Solar Radiation (W/m ²)
Spring	2 to 2.8	778
Summer	2 to 2.8	904
Autumn	2	678
Winter	2	515

Table 6: Field Power and Solar Radiation Summary

CHAPTER 6: Conclusions and Recommendations

6.1 Conclusions

The primary purpose of this project was to evaluate the performance of a solar racking system placed at a large closed cap landfill in the Los Angeles area. To evaluate the performance of the solar racking system the geotechnical effects, power monitoring and vegetation growth were monitored throughout a period of one year. Below are the major conclusions from the project.

- *Geotechnical Effects:* Monitoring data showed that the load of the solar racking system did not have a significant effect on the stability of the landfill cover.
- *Vegetation Growth:* Site inspections conducted throughout the year indicated that the vegetation growth under Unit 2 and Unit 3 was slightly affected by the placement of the solar racking system. No solar panels or plywood were installed on Unit 1, so as a result, the vegetation around Unit 1 was not affected. No cap penetration caused by the footings of the solar racking system was observed during the project.
- *Power Performance:* The power performance of the unit was in agreement with the manufacturer's reported value.

6.2 Recommendations

Results from the project showed that the placement of a solar racking unit did not have a significant impact on the geotechnical stability of the landfill cover at the site. It was expected that the geotechnical effects caused by the placement of the solar racking units would not affect the landfill cover because landfill covers are typically designed to handle much heavier loads than the solar racking units (2000 lbs). Settlement was also expected not to be significant because the site has undergone significant biodegradation since the waste was placed over 20 years ago. Vegetation growth was slightly impacted (vegetation growth in the trench areas where the geotechnical sensors were placed did not return) in the area of the solar racking unit. The power performance of the solar racking unit was in agreement with the manufacturer reported performance.

The next step in the development of a large solar farm would be to install a 1-acre solar farm on a major closed cap landfill. Because every landfill is different it is crucial to understand the landfill cover design and the age of the waste. Four items that should be further investigated include the following:

- Investigate the effect of vegetation growth on a larger solar racking system.
- Investigate the geotechnical effects when solar racking units are placed close to slopes.
- Monitored the power produced from the solar racking units to the power grid system.
- Evaluate the start-up and operational, maintenance and monitoring (OM&M) cost of a 1 acre solar farm.

1 INTRODUCTION

California is currently home to 225 closed landfills that can be suitable for the development of utility scale solar farms. The 225 closed landfill sites currently occupy 35,000 acres of land that is currently not economically viable for traditional development. Although this work plan (WP) focuses on performing research on developing utility-scale PV solar developments on a closed capped landfill, there are also 1,262 contaminated sites occupying over 2 million acres in California where the results of the research could be further applicable. Closed landfill sites are ideally suited for the development of utility scale renewable energy projects since in general, they are:

- Close to electricity demand
- Close to transmission and distribution line infrastructure
- Not economically viable for traditional development
- Under regulatory restrictions via institutional controls
- Large flat parcels of previously disturbed land
- Already producing electricity from landfill gas

Although these sites at first glance seem perfect for the development of large scale renewable energy projects, there are some critical technical parameters which need to be further investigated and studied before a renewable energy solar-landfill can be developed. To date, there are limited reference materials and data available to the solar-landfill developer, such that each project is uniquely designed without a significant background of technical guidance and essential design criteria. Geotechnical data collected during the pilot-study will facilitate in the scale-up and design of larger solar facilities.

Design-critical topics such as PV racking systems to minimize cap penetration, long-term landfill settlement, storm water runoff, seismic stability, and the overall effects a renewable energy project would have on the vegetative growth component of an evapotranspirative landfill cap/cover (specific to California) need to be studied and addressed.

In this WP, we are conducting a study to test the performance of a self ballasting racking solar system. The program will involve the placement, and one-year monitoring of instrumented, self contained, racking solar system on a closed landfill site. Project Navigator, Ltd. (PNL) has purchased a solar racking system from SunPod, Inc. located in San Jose. The SunPod units are

self ballasted, in theory, as a result the units will not penetrate the cap of a landfill, however this issue has not been exhaustively field tested under well monitored conditions at a pilot scale level.

During the pilot study ("the Project") data will be collected that encompasses the issues, outlined above. This data will then be compiled and published as a white paper in the public domain, to the overall benefit of PV solar power development in California.

1.1 PROJECT DESCRIPTION AND OBJECTIVE

The Project primary objective is to study the performance of a self ballasting solar panel racking system on the top deck of a closed landfill and show the viability of a PV solar development on California landfills. Performance will be measured in terms of soil settlement, solar radiation, vegetative growth and solar panel power output. The Project consists of the assembly of three solar panel racking units and monitoring the impacts of these units on the landfill top cover. The Project consists of the following key tasks:

- 1) Project kick-off meeting.
- 2) Identification of a landfill site for the placement of a solar panel racking system.
- 3) Project documentation consisting of a Project Work Plan (WP).
- 4) Procurement and tracking of all materials required for a solar panel racking and monitoring system.
- 5) Mobilization of the solar racking system and instrumentation to the selected landfill site.
- 6) Assembly and placement of a solar racking system on the top deck of the selected landfill.
- 7) Installation of sensors and data loggers to monitor soil pressure (load), soil deformation (movement), solar radiation and solar panel power output.
- 8) Monthly landfill visits to inspect the solar racking system and download field data.
- 9) Prepare a field data database and evaluation.
- 10) Prepare monthly progress reports.
- 11) Demobilization of solar racking system and instrumentation from landfill.
- 12) Preparation of final report summarizing key findings and recommendations.

1.2 PROJECT SCHEDULE

The following schedule shows the estimated timeframe of major tasks described in this WP:

Task	Duration
Project Kick-Off Meeting	September 12, 2011
Landfill Selection	September 12 through November 25
Project Documentation Preparation	November 28 through February 13
Procurement	November 28 through January 20, 2012
Mobilization	February 8, 2012
Assembly and Placement of Solar Panel	February 9, 2012
Installation of Sensors and Data loggers	February 9, 2012
Monthly Landfill Visits	March 5, 2012 through July 1, 2013
Field Database and Visuals / Graphs	March 6, 2012 through July 1, 2013
Monthly Progress Reports	March 12, 2012 through July 8, 2013
Demobilization	July 2, through July 5, 2013
Final Report	July 5 through July 31, 2012

Figure 2 shows a Gantt chart of the Project Schedule.

2 SOLAR RACK SYSTEM PLACEMENT AND INSTRUMENTATION INSTALLATION PROCEDURES

This section presents details of the specific work control protocol and project management for Project activities. Details of technical protocol are described in the following subsections.

2.1 PROJECT PREPARATION

In preparation for field work, PNL will prepare submittals/work plans; assemble personnel, equipment, instrumentation and review health & safety procedures. Project activities are further discussed in the following subsections.

2.1.1 Submittal Preparation

The Project WP will be submitted to CEC for review and approval before field operations are initiated.

2.1.2 Health and Safety

All Health and Safety procedures will be in accordance with NCI Health and Safety Plan. All Health and Safety procedures will be reviewed prior to any field work performed to ensure all procedures are in accordance with NCI Health and Safety Plan. The Health and Safety procedures include:

- Sign in at the NCI office trailer when entering the site and signing out when leaving the site.
- Any new personnel visiting the site will participate in a brief health and safety meeting. The health and safety meeting will be conducted by the NCI Health and Safety Officer.
- Level D Personnel Protect Equipment is required on the top deck of the OII Landfill which includes:
 - o Coveralls or clothing appropriate for the task
 - o Safety glasses
 - o Hard Hat
 - o Steel-Toe Boots
- All personnel working on the top deck will be required to be 40-HAZWOPER Trained or be supervised by NCI personnel.

- All visitors to the top deck will be required to be accompanied by NCI personnel.

2.1.3 Field Personnel Mobilization

Key personnel for the field work include the project manager, project engineer, electrician, field technicians and personnel from NCI and PNL.

2.1.4 Project Site Access

Only personnel approved by the NCI will be allowed to be onsite.

2.2 **SITE SELECTION**

2.2.1 Selection of Landfill Pilot Study Location

The OII Landfill Superfund Site located at 900 Potrero Grande Drive, Monterey Park, CA was selected as the pilot study location. The site was selected for the following reasons:

- Proximity to local power station
- Closed landfill with a 2 ft cover
- Excellent characterization of site (e.g. extensive geotechnical studies / data)
- Relatively flat top deck area
- Large deck area for future solar facility scale-up

The OII Landfill operated from 1948 to 1984 and accepted 30 million tons of solid municipal waste and 300 million gallons of liquid chemicals. The Pomona Freeway divides the 190-Acre into two parcels namely, the South (SP) and North Parcels (NP). The SP portion of the Site consists of 145 acres while the NP consists of the remaining 45 acres. In January 1984, the State of California placed the OII Landfill on the California Hazardous Waste Priority List, because of its contamination of air (e.g. methane, vinyl chloride etc.), groundwater (e.g. tetrachloroethylene, benzene, chloroform etc.) soil media and the concern of the well-being of the nearby community. The OII Landfill formally ceased operations in 1984. The EPA placed the OII Landfill on the Superfund's National Priority List in May 1986. See Figure 1 showing the location of the OII Superfund Landfill Site. The solar panel units will be placed at the top deck of the SP. The landfill is currently in Operational Maintenance and Monitoring (OM&M) since the SP remedy was completed in 2000. OM&M activities include the following tasks:

- Maintenance of the 2 ft vegetative cover

- Extraction and monitoring of landfill gas
- Extraction and monitoring of groundwater
- Treatment of landfill gas and groundwater

Since the geomembrane liner (located 2ft below the grade) will not be penetrated during the project no permits will be required to conduct the project. The liner's function at the landfill cover is to control the migration of landfill gas and to prevent the infiltration of liquids. See Appendix D for the access agreement with NCI.

2.2.2 Selection of Sites within the Landfill

The solar racking units will be placed on the top deck of SP in two areas that are representative of the landfill. A pair of solar racking units will be placed in the vicinity of settlement monuments so data can be validated from the deformation sensor. Settlement monuments are currently surveyed twice a year. More than ten years of settlement data exist for these locations at SP and is the ideal location to place solar panel units. See Figure 4 for the location of the solar racking units on the top deck of SP. Three solar panel racking units will be placed to mimic a solar panel array. Two solar racking units will be placed next to each other while the other unit will be placed at a distance from the first two and aligned to represent the end of the row of solar panels (See Figure 4).

2.3 SOLAR PANEL RACKING SYSTEM ASSEMBLY AND PLACEMENT

PNL will procure three self ballasting solar panel racking units which will consist of the following components:

- Unit 1: SP-100 Unit bare frame with weight added to simulate the weight (solar panels, inverter and electrical instrumentation) of full solar racking unit.
- Unit 2: SP-100 with ply wood covering the rack with added weight (inverter and electrical instrumentation) to simulate the weight and shading of a full racking unit.
- Unit 3: SP-300 off-grid unit with solar panels and all electrical instrumentation necessary to generate and monitor electricity.

Sunpods, Inc will manufacture the three units at the San Jose facility and deliver the units to the OII Superfund Landfill Site. Sunpods Inc, will deliver the units with a pickup truck pulling an equipment trailer. The Sunpod units will be placed on the trailer and delivered to the OII Landfill Superfund Site. The pickup truck with the equipment trailer will be escorted to the top deck of the

SP of the Oil Landfill through the landfills access road by NCI personnel. Once on the top deck the pickup truck will go off the access road and place the units on the designated areas. Figure 3 shows the construction diagram of the solar panel racking unit. As the Figure 3 shows the area of the frame is 9.52' x 21.75', the length of the unit legs are 32" and the area of the foot of each leg is 1 square foot. Typically the weight of a SP-300 unit is approximately 2,000 lbs so an additional 700 lbs will be able to unit 1 and 500 lbs will be added to unit 2.

Solar panels will be assembled off-site. Placement of solar panel units is shown on Figure 4 and will be performed by Sunpod field personnel. No solar panel units will be placed on slopes. All units will be placed on the top deck of SP which is relatively flat. Solar panel units are self ballasted and will not be anchored. The units are designed to withstand winds of 90 mph, average winds speed in Los Angeles through out the year are approximately ~ 6 mph. Units 2 and 3 will be placed adjacent to each other.

Vegetation will be removed in areas where geotechnical sensors will be placed by NCI field personnel. Five areas of vegetation consisting of 2 ¼ x 2 ¼ sq ft will be removed by NCI personnel using a shovel

2.4 INSTALLATION OF SENSORS AND DATALOGGERS

Sensors will be installed to log important field parameters such as soil pressure / load from the solar panel racking system, settlement, solar radiation, power output and meteorological conditions.

Trenches will be prepared for geotechnical sensors and backfilled with cover material. To ensure that the liner will not be penetrated the trenches will only be excavated at a depth of 1.7 ft. Preparation of shallow trenches will be conducted by NCI using shovels and the placement and installation of sensors will be conducted by an electrician.

2.4.1 Instrumentation

Below is the list of the instrumentation that will be used during the Project.

- Geokon Vibrating Wire (VW) Earth Pressure / Load Cell Model 4800-1-70kPa: Four Earth Pressure / Load Cells were purchased from Geokon to monitor the load placed on the cover of the landfill by the solar racking system. Earth Pressure Cells are designed to measure stresses in soil and the pressure of soil on structures / equipment. The Earth Pressure Cells used in the Project are constructed of two stainless steel flat plates that are welded together around the periphery and are separated by a small space that is filled with hydraulic fluid. When a load is applied the soil pressure acts to

squeeze the two plates resulting in the buildup of pressure inside the fluid. The hydraulic fluid is connected hydraulically to a pressure transducer where the fluid pressure is converted to an electrical signal and further is transmitted through a cable to the data logger (Geokon Model 8002-4-2). See Figure 5 for a schematic of the Earth Pressure / Load Cell. The Earth Pressure / Load Cells are rated at 10 lbs / in². The four Earth Pressure / Load Cells will be placed under the outer legs of the adjacent racking units as shown on Figure 7.

Load Cells are calibrated by the manufacturer. The approximate load of each load cell will be around ~ weight of soil + weight of each leg ~ 700 lbs /sq ft. If values are much smaller or larger than 700 lbs/ sq. ft then load cell is not properly functioning. We will take the initial reading before we backfill the trench as well as when we backfill.

- Geokon Data Logger Model 8002-4-2: One Data Logger Model 8002-4-2 was purchased to collect field data from the four Earth Pressure / Load Cells. Model 8002-4-2 is battery powered data logger and reads four VW sensors equipment with thermistors. Thermistors will measure temperature at the four locations of the sensors. The data logger comes with a USB cord to allow easy download of data and is enclosed in a NEMA 4X protective box. The unit comes with Geokon LogView software to allow the communication between the data logger and PC. At a constant temperature of 25 °C the battery life of two D-Cell lithium batteries at a sampling frequency of 1 hr can operate at a maximum of one year without battery replacements. The sampling frequency of the geotechnical sensors set to every hour until the duration of the project (e.g. 24 sample points per day).
- Geokon VW Deformation Meter Model 4430: One Deformation Meter was purchased to collect axial deformation in the cover as a result of the solar panel racking system load. The deformation meter consists of a VW strain gage in series with a precision music wire spring which is coupled to a movable shaft. As the shaft moves in and out of the sensor, the tension in the spring and the VW strain gage changes. The change in tension is directly proportional to the amount of extension and a calibration factor that relates the frequency of vibration to the amount of extension is determined. The deformation meter consists of a VW sensor that is attached to a flange at one end and connected by a rod of a specific length to a flange at the other end. The VW sensor and rod are covered by PVC tube which holds the flanges apart at a predetermined distance and insures that the rod is free to move and also holds a thermistor. As the flanges move apart the movement is conveyed by the connected rod to the VW sensor and recorded by a data logger. Figure 6 shows a schematic diagram of the

deformation sensor. The Location of the deformation sensor will be between the two adjacent solar panel racks ss shown on Figure 7.

- **Geokon Data Logger Model 8002-1-2:** One Data Logger Model 8002-1-2 was purchased to collect field data from the single deformation sensor. Model 8002-1-2 is battery powered data logger and reads one VW sensors equipment with thermistors. The data logger comes with a USB cord to allow easy download of data and is enclosed in a NEMA 4X protective box. The unit comes with Geokon LogView software to allow the communication between the data logger and PC. At a constant temperature of 25 °C the battery life of two D-Cell lithium batteries at a sampling frequency of 1 hr can operate at a maximum of two years without battery replacements. The sampling frequency of the geotechnical sensors set to every hour until the duration of the project (e.g. 24 sample points per day).
- **Power Data Logger:** One power data logger (MATE3) will be purchased to data logger the power output from Unit 3. The power data logger will be purchased from Outback Power.
- **WE300 Solar Radiation Sensor:** The WE300 Solar Radiation sensor is a precision pyranometer that utilizes a high stability silicon photovoltaic detector to obtained accurate readings. One pyranometer was purchased from Monarch Instruments and is rated at 1,500 W / m². The output signal from the pyranometer is 4-20 mA.
- **Track-It™ Current Data Logger:** The Track-It™ Current Data Logger is a single current input data logger manufactured by Monarch Instruments and comes with a NEMA 4X protective enclosure for harsh environments. Data is downloaded through a USB cable and lithium batteries are rating for year for a sampling rate of 1 min. The data logger will be used to log data from the pyranometer.

2.4.2 Installation

VW Earth Pressure Cell

Check that the Earth Pressure Cell is properly functioning before placement in soil. Press the cell, and check that the readout digits have changed. Increasing the pressure on the cell will cause the readout digits to fall. If no changed in the readout digits occurs then return the Earth Pressure Cell to the manufacturer. Checking for electrical continuity is also important to ensure that the Earth Pressure Cell is properly functioning. Using an ohmmeter, check that the resistance between the VW strain gage leads is at 180 ohms for proper functioning. Each Earth Pressure Cell comes with a calibration sheet that shows the relationship between the

readout digits and pressure. Below are the instructions to install the VW Earth Pressure Cell inside the landfill cover:

1. Prepare a trench no more than 1.7 ft. deep to place the Earth Pressure Cell and cables. Trenches below 2 ft are not allowed since the landfill cover liner is located at that depth. Penetration of liner or disturbances of waste will not be performed during placement of Earth Pressure Cell.
2. The width and length of the trench should be at least/not more than 2 ¼' x 2 ¼'.
3. Using a leveler ensure that the surface of the trench is flat.
4. Position the cells on a thin layer of non-shrink sand cement grout. See Table 3 for Cement/Bentonite/Water ratios. Grout mix for medium soils will be used for the project.
5. Nail the position of the cell by using the lugs on the cells provided.
6. Initial reading must be taken and carefully recorded along with the barometric pressure and temperature at the time of installation. Take the initial readings while the cell is in position, just prior to it being covered by fill and pouring of concrete. **It is imperative that initial readings at zero load are taken.** (see page 16 of user manual)
7. Backfill the excavated pocket to a depth of 300 mm with a grout mix in 100 mm layers, vibrated with a poker vibrator or equivalent equipment.
8. After 24 hours pressurize the Earth Pressure Cells by pinching the pinch tubes until in the pressure in the cell starts to change as shown on the readout digits.
9. Backfill the instrumentation location containing the grouted Earth Pressure Cells and cable trench in 250 mm layers, using the same material as the cover material placed by hand and compacted with pneumatic backfill tampers or equivalent equipment.
10. Earth Pressure Cells are to be protected by flexible pipe. See page 16 of the user manual for trench cable preparation.
11. Earth Pressure Cells cables should not be run with any AC power lines.
12. Proceed to fill and compact until top of surface is reached.

See Appendix B.1. for further information and detail regarding the VW Earth Pressure Cell technical information and installation.

VW Deformation Sensor

Check the VW strain gage and the thermistor for proper operation. In position "B" the VW strain gage should read between 2,000 and 8,000 digits. Then slightly pull on the end of one of

the flanges, the reading should increase. If the reading does not increase return the VW deformation meter to manufacturer. Similar as with the VW Earth Pressure Cell check the electrical continuity using an ohmmeter. The resistance between the VW strain gage should be approximately 180 ohms. The resistance between the green and white conduit should be between 3000 ohms at 25 °C and between any conductor and the shield should not exceed 2 mega ohms. Below are instructions to install the VW Deformation Meter inside of the landfill cover:

1. Prepare a trench no more than 1.7 ft. deep to place the VW deformation sensor. Trenches below 2 ft are not allowed since the landfill cover liner is located at that depth. Penetration of liner or disturbances of waste will not be performed during placement of deformation sensor.
2. The width and length of the trench should be at least/not more than 2 ¼' x 2 ¼'.
3. Make sure that the surface of the trench is flat using a leveler.
4. Lay the VW deformation sensor in the trench and backfill with material which has had any large (> 10 mm) aggregate removed.
5. Backfill and hand compress the first half foot and then proceed with the compaction of the fill.
6. Cables should be run in trenches and backfilled in the same way as the VW deformation meter.
7. Use a flexible conduit to protect the cables from the VW deformation meter once backfilled inside the trench.
8. Do not bury or run AC power lines with VW Deformation cables.

Conduct lighting protection as shown in the VW Deformation Meter user manual provided in Appendix B.2.

Geokon Data Logger Model 8002-4-2

Below are the procedures to start and connect the four VW Earth Pressure Cells to the Model 8002-4-2 data logger:

1. Install the LogView software onto the project laptop.
2. Remove the NEMA 4X protective cover by unscrewing the four screws with a Phillip screwdriver.
3. Insert the two D-Cell lithium batteries.

4. Connect the VW Earth Pressure Cell cables to the data logger input ports as shown in table 4 for each sensor.
5. Connect the USB cable from the project laptop to the datalogger USB connection.
6. If laptop does not recognize the data logger review the data logger troubleshooting section located in Appendix C.1.
7. Set the timer and frequency of sampling.

Geokon Data Logger Model 8002-4-2

Below are the procedures to start and connect the VW Deformation Meter to the Model 8002-1-2 data logger:

1. Install the LogView software onto the project laptop.
2. Remove the NEMA 4X protective cover by unscrewing the four screws with a Phillip screwdriver.
3. Insert the two D-Cell lithium batteries.
4. Connect the VW Deformation Meter cables to the data logger input ports as shown in table 4.
5. Connect the USB cable from the project laptop to the datalogger USB connection.
6. If laptop does not recognize the data logger review the data logger troubleshooting section located in Appendix C.2.
7. Set the timer and sampling frequency.

WE300 Solar Radiation

Below are the instructions to connect the WE300 solar radiation sensor to the Track-It data logger:

1. Install the Track-It software onto the project laptop.
2. Install the lithium battery inside the Track-It data logger.
3. Connect the pyranometer cables to the data logger input as shown in table xx.
4. Connect the USB cable from the project laptop to the Track-It data logger.
5. Set the data logger time and sampling frequency.

6. Remove the USB cable connecting the project laptop and data logger.
7. Place the data logger inside of the NEMA 4X protective box and using a Phillip screwdriver tighten the four screws to close.
8. Mount the NEMA 4X box onto the two poles.

3 SAMPLING AND ANALYSIS PLAN

During each Site visit a daily report should be filled out which is provided in Appendix A. For each Site visit the following materials should be brought to the Site. After the installation of the sensors, monthly visits to the OII Landfill Superfund Site will be conducted to download data from the data loggers and records/document vegetation growth in the vicinity of the solar panel units. A visual inspection of the vegetation around the solar panel units will be noted and document during monthly visits.

1. Clip Board
2. Camera
3. Pen
4. Field Daily Report
5. Phillip Screw Driver
6. Ohmmeter
7. A and D-Cell Lithium Batteries
8. Laptop
9. USB data logger cable connections

3.1 VW EARTH PRESSURE CELL

During each landfill visit the following tasks will be conducted.

Field Work:

1. Check the voltage of each lithium battery. If the combined voltages for both batteries fall below 2V replace the old batteries with a new set of batteries.
2. Set the sampling frequency to one hour.
3. Connect the USB cable to the datalogger and download the excel spreadsheet that contains all data for the four sensors.
4. Delete the earlier month's data to ensure enough space is allocated for the next month data. The data logger will store two months data, the current month's data along with data from the previous month.

5. Remove the USB cable connected to the data logger.

Office Work:

6. Convert digits to pressure using the equation below:
7. $P = (R1 - R0) \times G$

Where,

P = Soil Pressure (lbs / in²)

R1 = Current Reading

R0 = Initial Reading

G = Calibration Factor

8. If temperature is fluctuating include the temperature correction factor from the equation below:
9. $P = (R1 - R0) \times G + (T1 - T0) \times K$

Where,

P = Soil Pressure (lbs / in²)

T1 = Current Temperature

T0 = Initial Temperature

K = Thermal Factor

10. Update the Project database
11. Update pressure load vs. time figures

3.2 VW DEFORMATION METER

During each landfill site visit the following tasks will be conducted.

Field Work:

1. Check the voltage of each lithium battery. If the combined voltages for both batteries fall below 2V replace the old batteries with a new set of batteries.

2. Set the sampling frequency to one hour.
3. Connect the USB cable to the datalogger and download excel spreadsheet that contains all data for the sensor.
4. Delete the earliest month's data to ensure enough space is allocated for the next month data. The data logger will store two months data, the current month's data along with data from the previous month.
5. Remove the USB cable connected to the data logger.

Office Work:

6. Convert digits to pressure using the equation below:
7. $D = (R1 - R0) \times C \times F$

Where,

D = Deformation (in)

R1 = Current Reading

R0 = Initial Reading recorded at installation

C = Calibration Factor (in)

F = Engineering unit conversion factor

8. If temperature is fluctuating include the temperature correction factor from the equation below:
9. $D = (R1 - R0) \times C \times F + (T1 - T0) \times K + Lc$

Where,

D = Deformation (in)

T1 = Current Temperature

T0 = Initial Temperature

K = Thermal Factor

Lc = Correction gage length coefficient

10. Update the Project database

11. Update pressure deformation vs. time figures

3.3 SOLAR RADIATION SENSOR (PYRANOMETER)

During each landfill site visit the following tasks will be conducted.

1. Check the voltage of each lithium battery. If the combined voltages for both batteries fall below 2V replace the old batteries with a new set of batteries.
2. Set the sampling frequency to 30 minutes.
3. Connect the USB cable to the datalogger and download excel spreadsheet that contains all data for the sensor.
4. Delete the earliest month's data to ensure enough space is allocated for the next month data. The data logger will store two months data, the current month's data along with data from the previous month.
5. Remove the USB cable connected to the data logger.
6. Update the Project database
7. Update pressure solar radiation vs. time figures

3.4 POWER METER

1. During each Site Visit the following tasks will be conducted.
2. Check the voltage of each lithium battery. If the combined voltages for both batteries fall below 2V replace the old batteries with a new set of batteries.
3. Set the sampling frequency to 30 minutes.
4. Connect the USB cable to the datalogger and download excel spread sheet that contains all data for each sensor.
5. Delete the earliest month's data to ensure enough space is allocated for the next month data. The data logger will store two months data, the current month's data along with data from the previous month.
6. Remove the USB cable connected to the data logger.
7. Update the Project database
8. Update pressure solar power vs. time figures

Rack Dimensions is 261" x 114.19"

PARTS LIST					
ITEM	QTY	DESCRIPTION	SIZE	THICKNESS	FINISH
1	10	6"X6" CLIP	6"X6"	127 MIL	G90
2	4	LEG			G90
3	4	FOOT PLATE	12"X12"	250 MIL	G90
4	2	CHASSIS TRACK	8"X2"	127 MIL	G90
5	5	CHASSIS STUD	8"X3.5"	127 MIL	G90
6	3	BACK SUPPORT			G90
7	2	400T200-97-1908	4"X2"	97 MIL	G90
8	14	400S200-68-0909	4"X2"	68 MIL	G90
9	8	J-TRACK RAIL	3"X0.5"	54 MIL	G90

NOTES

54 MIL AND GREATER SECTIONS HAVE A 50 KSI YIELD FOR ADDITIONAL STRENGTH.

THE MINIMUM HOT DIPPED GALVANIZED COATING FOR 68 MIL AND UP USES G90 COATING.

WILL MEET CODES: ASTM A879, ASTM A653, ASTM A925, ASTM C645, ASTM C955, & ASTM A1003.

WE300 Solar Radiation Sensor

Rugged Solar Radiation Transmitter

Features

- Accurate 4-20 mA output
- Marine grade cable with strain relief
- Precision mounting equipment included

Description

Global Water's WE300 Solar Radiation Sensor is a precision pyranometer that uses a high stability silicon photovoltaic detector (blue enhanced) to obtain accurate readings. The WE300 includes a bubble level, leveling screws, and mounting hardware for a quality installation. The sensor is attached to electronics by 10' of cable, and the electronics are attached to 25' of marine grade cable, with lengths up to 500' available. To ensure moisture protection, you can enclose the sensor and electronics in a protective housing. The sensor's output is 4-20 mA with a two wire configuration.

Specifications

Detector	High-stability silicon photovoltaic detector (blue enhanced)
Output	4-20 mA
Range	0 to 1500W/m ²
Spectral Response	400 to 1100 nm
Accuracy	± 1% full scale
Operating Voltage	10 to 36 VDC
Current Draw	Same as sensor output
Warm-up Time	3 seconds minimum
Operating Temperature	-40° to +55°C
Sensor Size	3" dia. x 1 1/2" long (7.6 cm dia. x 3.8 cm long)
Weight	0.25 lb (114 g)

Track-It™

DC Voltage and Current Data Loggers

Description

The Track-It™ DC Voltage and Current Data Loggers are two channel battery powered stand alone compact data loggers that record up to 32,000 samples each of DC Voltage or Current data. Units are available in 4 DC voltage ranges or for DC current. The unit is easily configured using the included Track-It™ Software. Simply plug the logger into an open USB port on your PC and the software automatically identifies the logger. Configure the unit to start and stop recording at a predetermined time and date or only when an alarm condition is sensed. The sample storage rate can be set from 1 sample every 2 seconds to 1 sample every 24 hours. The on board data storage is non-volatile so data will not be lost in the event of a depleted battery.

The Track-It™ DC Voltage and Current Loggers can also be used to record ambient temperature if one or neither input is being used. Information displayed on the LCD is also user programmable and can be sequenced by pressing the logger button. A multicolored LED indicator notifies the user of alarms, or general activity.

Features

- Push button or program to start recording
- Up to 64,000 samples per record
- 500mVDC, 1VDC, 5VDC, 10VDC, or 20mA
- +/- .5% accuracy
- Alarm set points
- Small compact size
- N.I.S.T. calibration available
- Integral USB interface (no custom cable!)
- Interactive software (included!)
- One year battery life (battery included!)
- Optional five year battery life
- High accuracy and repeatability
- Accurate internal clock (1 minute/year)
- Multiple user programmable displays

Typical Uses

- Industrial process
- Troubleshooting
- Productivity monitoring
- Remote indication

Track-It™ DC Voltage and Current Data Loggers

Specifications

General

Record:	Sample Rates: User configured 1 every 2 seconds to 1 every 24 hours No. of Samples: 32,000 or 64,000 (depends on config)
Record Trigger:	Two independent triggers. Multiple trigger modes: Instantaneous, button control, on alarm, time and date (start and stop), day of week
Record Mode:	Fill to end of memory, cyclic, number of samples, time duration
Display:	4 digit LCD (Non display versions available with LED only) User programmable: Indication of data value, eng units, alarms, record mode, battery condition, time/date, memory
LED:	User programmable: Indication of alarms, recording, triggered
Button:	User programmable: View display, record on/off, reset alarms, reset timer
Alarms:	2 user programmable alarms. High or Low
Communication:	Direct USB connection
Software:	Track-It™ Software—Program device, view data (historic or real time), export to Excel™. Simple and advanced modes
Battery:	Coin Cell Option: Battery: Lithium CR2032 Life: 1 year @ 1 minute sample rate Hi Energy Option: Battery: EF651625 Life: 3 years @ 1 minute sample rate
Dimensions:	4.06" (10.32cm)L x 0.66" (1.67cm)H x 1.00" (2.54cm)W

Measurement

Temperature Range:	-20 to +85°C / 0 to 185°F
Accuracy:	±1°C 0 to 50°C / 32 to 122°F ±2°C -20 to 85°C / -4 to 185°F
Resolution:	0.4°C / 1°F
Clock Accuracy:	±1 minute/year

Available Analog Modules (for DC V/I)

Range:	0 to 500mV (no preconditioning)
Accuracy:	±0.5% of full scale
Resolution:	±0.1mV
Input Modules	500mV, 1V, 5V, 10V, 20mA

Track-It™ Software

Track-It™ Software is a powerful Windows based software package that is included with every Track-It™ Data Logger. It allows for easy setup, retrieval, interpretation and export of the recorded data. Simply connect your Track-It™ data logger to an open USB port and begin communicating immediately.

Point and click to select your sample interval, alarm set points, engineering units, start recording triggers and LCD Displays.

View a numerical data table or graphical representation of data readings relative to time. Use the graph tools such as zoom, cursor, min and max to examine and analyze the record. Track-It™ Software turns your PC into a real time data acquisition system by allowing you to stream graphical or tabular data directly to your PC (capability varies by model). Use the one click export function to automatically export stored data into an Excel spreadsheet.

NEW CURE, INC.

**ACCESS AGREEMENT TO PERFORM A TEST OF A PILOT PHOTOVOLTAIC
(PV) POWER GENERATION SYSTEM ON THE OPERATING INDUSTRIES,
INC., (OII) LANDFILL SITE, MONTEREY PARK, CALIFORNIA**

This access agreement ("Agreement") to install, test the performance of a PV power generation system, then remove the system (the "Project") is between **Project Navigator, Ltd.** ("PNL") and **New Cure Inc. (NCI)** and shall take effect when an executed copy of this Agreement is delivered by NCI to PNL. This program is being funded by a grant provided to PNL by the State Energy Resources Conservation and Development Commission (Energy Commission, Agreement Number 500-10-061, dated June 17, 2011).

1. **Performance of Work.** PNL will plan, install, operate, monitor and finally remove the PV racking system, (the "Work"), in accordance with the terms and conditions of this Agreement.
2. **Standard of Performance.** PNL represents and warrants that each staff person to be assigned to perform the Work is fully qualified to conduct the Work required hereunder. PNL shall be responsible, to the level of competency presently maintained by other practicing professionals performing the same type of Work in the State of California, for the professional and technical soundness, accuracy and adequacy of all Work performed under this Agreement.
3. **Scope of Services and Deliverables.** The Work to be undertaken by PNL is described in **Attachment A**.
4. **Changes.** PNL will provide written notice to NCI of any significant planned changes in the work, before proceeding with the work. No changes shall be implemented by PNL unless they are first approved by NCI in writing.
5. **Time of Performance.** The onsite Work is planned to start on November 2011 and be completed by May 2013.
6. **Compensation.** No compensation will be paid to from one of the parties in this Agreement to the other, under the terms and timeframe of this Agreement.
7. **Ownership of Documents.** All *final* documents, studies, graphics, maps, photographs and reports prepared by PNL under this Agreement shall be the property of the California Energy Commission. NCI shall the right to review, and

suggest changes, as appropriate, to all work products. Both PNL and NCI shall have the right to use in ways that do not compromise CEC's interests.

8. **Insurance.** PNL shall maintain insurance in the minimum amounts set forth below. Before beginning work on the Project, and, upon NCI's request, PNL shall provide NCI with certificates evidencing full compliance with the requirements of this provision:

Minimum Required Insurance	Per Occurrence	Aggregate
a. Workers Compensation		
Statutory Employer's Liability.....	\$1,000,000	\$2,000,000
b. Comprehensive General and Contractual Liability:		
- Bodily injury or property damage	\$1,000,000	\$2,000,000
- Personal injury, with employee exclusion deleted		\$1,000,000
c. Comprehensive Automobile Liability for all owned, hired and non-owned vehicles:		
- Bodily injury and property damage	\$1,000,000	\$2,000,000
d. Professional Liability	\$2,000,000	\$2,000,000

The insurance certificates to be provided to NCI shall be endorsed to include the Client as an additional insured on the Comprehensive General and Contractual Liability policy and to provide the Client with 30 days prior written notice of cancellation.

9. **Indemnification and Releases.**

9.1 Indemnity

PNL shall defend, protect, indemnify and hold NCI, CURE, Inc. a subsidiary of NCI, the Custodial Trust (as defined in the Seventh Partial Consent Decree), and the members of the OII Steering Committee and their subsidiaries and affiliates and any of their directors, officers, representatives, agents and employees, successors, and assigns ("Indemnified Parties") free from harm against all claims, demands, losses, fines, penalties, and causes of action of every kind and character (including reasonable attorney fees and court costs) arising or alleged to arise from the acts

or omissions of PNL or its employees, agents or subcontractors, or arising or alleged to arise from PNL's Work under this Agreement, except to the extent arising from the sole negligence or willful misconduct of the Indemnified Parties.

9.2 Hazardous Conditions

PNL is aware that the OII Site may contain hazardous substances, pollutants or contaminants, and as between NCI and PNL, PNL knowingly and voluntarily assumes all risk of injury and damage to PNL, its principals, employees, agents, contractors or representative caused by exposure to such materials in connection with performing the Work at the Site. To the extent that performance of the Work requires PNL to operate at the Site, PNL shall take all measures necessary to protect PNL, and its principals, employees, agents, contractors or representatives against any hazards that might exist or occur in the performance of the Work.

9.3 PNL for itself, and its successors and assigns, releases and forever discharges the Indemnified Parties of and from any and all claims, demands, actions, causes of action, statutory rights, duties or suits, which PNL has or can hereafter assert against the Indemnified Parties arising from personal injury or death to PNL's principals, employees, agents, contractors or representatives, while performing the Work under this Agreement.

Section 1542 of the Civil Code of the State of California provides, generally, that a release does not extend to unknown claims. Specifically, Section 1542 states as follows: "A general release does not extend to claims which the creditor does not know or suspect to exist in his favor at the time of executing the release, which if known by him must have materially affected his settlement with the debtor".

For the purpose of implementing a full and complete release and discharge of the Indemnified Parties, PNL is aware of and expressly waives and relinquishes all rights and benefits afforded by Section 1542 of the Civil Code of the State of California and acknowledges that this Agreement is intended to include and discharge all claims against Indemnified Parties, which PNL does not know or suspect to exist at this time of execution.

10. **Independent Contractor.** In performing the Work, PNL shall act at all times as an independent contractor and shall have responsibility for and control over the details and means of performing the Work. PNL will be subject to the advice and directions of NCI with respect to the scope of the Work. NCI shall have the right to disapprove the use of any personnel, subcontractors, or purchased services or equipment.

11. **Successors and Assigns.** This Agreement shall be binding upon, and inure to the benefit of, the successors, assigns and legal representatives of PNL and NCI.
12. **Assignment.** PNL agrees that it shall not assign or subcontract the Work described herein, or any part thereof, without the prior written approval of NCI.
13. **Notice.** Written notice under this Agreement shall be deemed to have been duly given if delivered in person or sent by (a) certified mail, return receipt requested, (b) a nationally recognized overnight courier, or (c) an e-mail transmission with automatic answer back, to the addresses and e-mail addresses set forth on the execution page of this Agreement.
14. **Governing Law.** This Agreement shall be governed by and construed in accordance with the laws of the State of California.
15. **Compliance.** Regardless of where the Work is to be performed, PNL shall at all times comply with any and all applicable government laws, ordinances, statutes, standards, rules and regulations, including, but expressly not limited to, those relating to workers compensation, working hours, working conditions, safety and health, and environment, the OII Consent Decrees and the UAO. Where the Work is performed at the OII site, PNL shall also comply with any NCI safety standards which NCI provides to PNL.

PNL shall also comply with applicable laws, executive orders and regulations concerning nondiscrimination in employment, including, but not limited to, the equal opportunity clause of Section 202, Executive Order 11246, September 24, 1965, which is incorporated herein by reference.

16. **Notification of Violation or Inspection.** In the event that PNL receives a notice, warning, asserted violation or similar correspondence from a government agency concerning the Work or the NCI project coordinator, a notice of inspection concerning the Work or the Project, or the Work becomes the subject of a government inspection, PNL shall immediately orally notify NCI of such correspondence or PNL shall provide such oral notification to NCI prior to allowing government representatives access to the Work in connection with such an event.
17. **Suspension and Termination.** NCI may suspend or terminate this Agreement at any time by written notice to PNL whether or not PNL is in default. Upon receipt of a termination notice, PNL shall (a) promptly discontinue all Work (unless the notice directs otherwise), and (b) remove all solar power equipment, and return the Work location to the same condition it was in before commencement of the Work.

PNL may terminate this Agreement for good cause, upon ten (10) days written notice to NCI. Upon delivery of a termination notice, PNL shall (a) promptly discontinue all Work (unless the notice directs otherwise), and (b) remove all solar

power equipment, and return the Work location to the same condition it was in before commencement of the Work.

18. **Contract Term.** The terms and provisions of this Agreement shall remain in effect for two (2) years from the date of execution of said Agreement, unless extended by mutual agreement of the parties.
19. **Entire Agreement.** This Agreement represents the entire agreement between PNL and NCI and supersedes all prior negotiations, representations or agreements. This Agreement may be amended only by a written instrument signed by an authorized representative of both PNL and NCI.

In Witness whereof the parties hereto have executed this Agreement on the date set forth below.

ATTACHMENT A

SCOPE OF WORK

GENERAL DESCRIPTION

The overall goal is to monitor the operating performance, over the period of 12 to 14 months, of fixed tilt, self ballasting (ie no cap penetration), rack mounted PV power modules when placed on the cap of a closed landfill site in the Los Angeles basin.

Via preliminary discussions with the management of New Cure Inc. ("NCI"), Project Navigator, Ltd. has been granted access to conduct the test at the OII Landfill Site, Monterey Park, CA.

PV power generation systems will play a significant contribution in the State meeting a 33% renewable power goal by 2020 under AB 32. While some of the supply will no doubt be delivered by large (>500 MW) *centralized* PV facilities, which will be located in eastern Riverside, San Bernardino and Imperial Counties, a *distributed* PV power delivery network will need to be developed within the Los Angeles basin, where power can be generated close to the load points.

Desert land is inexpensive relative to urban land. This fact is a major economic hurdle in the PV facility siting process. Closed landfills, with their associated land use restrictions, become excellent PV systems siting locations.

While many such PV installations are purported to be in the planning stages in California, none have been permitted and built. There are no precedent setting studies, where a PV pilot system has been operated on capped landfill site. The present study will generate information which can hopefully help in the planning and design of future landfill-located PV solar power installations.

The project has the following major Phases:

PHASE 1: PLANNING AND INSTALLATION

The goals of this task are to install two 2.5 kilowatt (kW) photovoltaic rack mounted

power systems (or equivalent systems) on the top deck of the OII landfill for the purpose of data collection.

Based on a preliminary site visit with the Site Operations Manager, some proposed locations are shown in **Figure 1**. The exact locations will be decided in consultation with NCI.

Phase 1 tasks include:

- Develop a plan and work through the logistics for the installation of the solar rack mounted systems at the OII site
- Develop a Data Collection Plan for the installed solar rack mounted systems, describing the types of data to be collected and the frequency of data collection.
 - At time of writing it is envisioned that the information described in **Figure 2** will be collected.
- Install the self ballasting, solar rack mounted power systems at OII in accordance with the installation plan
- Prepare an Installation Report describing the installed systems, including any problems encountered, or work arounds performed during installation

PHASE 2: DATA COLLECTION

The goal of this phase is to collect data on the operational performance of the PV racks.

Phase 2 involves the collection of the following data and information (see **Figure 2**):

- Collect data as indicated in the Data Collection Plan. Create data tables for review to include, but not be limited to, the following:
 - Solar Intensity Data
 - Visual Inspection of Vegetative Growth
 - Visual Inspection of Landfill Cap around the system
 - Wind Speed and Direction
 - Precipitation
 - Power Generation Capacity
 - Tilt of Racked Unit
 - Temperature

- Prepare electronic data table files on a compact disc or equivalent

PHASE 3: DATA ANALYSIS

The goal of this phase is to compile results from the year long monitoring effort into a Data Analysis report, which can be used to guide the future development of solar energy projects at closed, capped landfill sites in southern California. PNL's work product will be in the form of a written report, which could also eventually be converted into a "guidance document" for solar developers, regulators and landfill owner/operators.

APPENDIX B
